

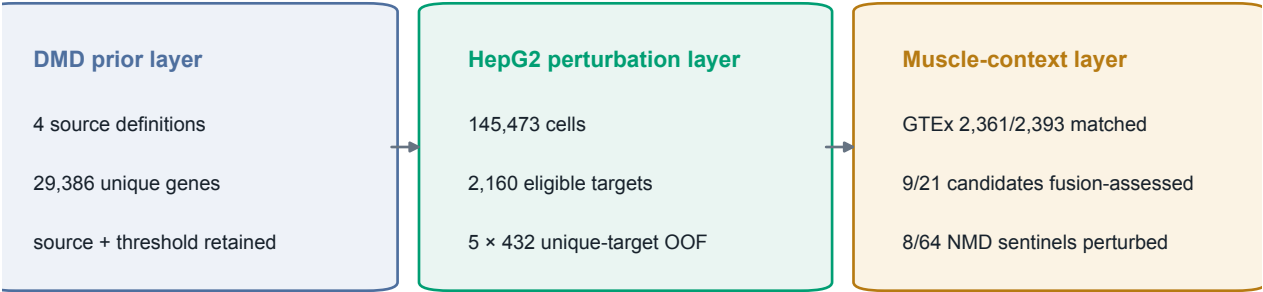

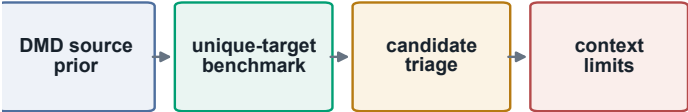

Figure 1 | Evidence layers and inference limits in NMD-VCe

Versioned DMD, HepG2 and muscle-context evidence are linked without treating context as perturbation validation.

a Three evidence layers retain their native denominators

b Primary and historical benchmark records are separated

Primary: 2,160/2,160 targets receive exactly one OOF prediction.

Historical audit: 787 targets reused; 514 never tested.

c Claim ceiling remains explicit
